

### General Description

The AAT3520 Series of PowerManager™ products is a member of AATI's Total Power Management IC™ (TPMIC™) product family. These microprocessor reset circuits are ideal for monitoring voltage supplies in portable systems, where extended battery life is critical. They provide a low cost, reliable solution by eliminating external components. The AAT3520 series operates by monitoring the system power supply voltage. When the input voltage drops below a fixed threshold, the device asserts a reset signal for a fixed time period after  $V_{CC}$  has risen back above the fixed threshold; 30ms and 150ms minimum periods are available. The AAT3520 product series is guaranteed to operate down to 1.2V and designed to ignore fast line transients appearing on  $V_{CC}$ . The AAT3520 series is available with three output stage versions: AAT3520 push-pull active high output, AAT3522 push-pull active low output and AAT3524 open drain active low output. The quiescent supply current is extremely low, typically 1 $\mu$ A, making it ideal for portable battery operated equipment.

The AAT3520/2/4 are available in a 3 pin SOT23 package and are specified over -40° to 85°C operating temperature range.

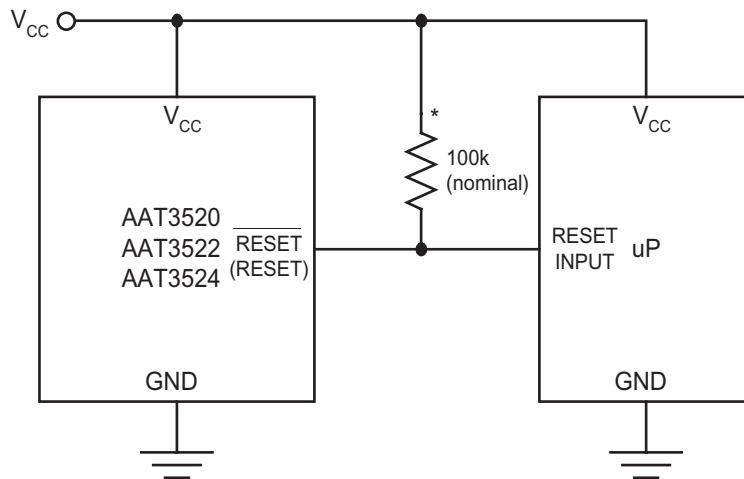

### Features

- 1.2V to 5.5V Input voltage range
- Operation down to 1.2V
- Extremely low quiescent current: less than 2 $\mu$ A
- High accuracy detection threshold:  $\pm 1.5\%$
- Monitor Power Supply Voltages
- Fixed thresholds from 2.2V to 4.6V
- Reset pulse width options
  - Minimum 30 ms or 150ms
  - Fast propagation delay <20 $\mu$ s
- Available output configurations:
  - Open-drain output
  - CMOS active high output
  - CMOS active low output
- Temp range -40 to 85°C
- 3 pin SOT23 package

### Applications

- Notebook Computers
- Cell Phones
- Portable Electronics
- Embedded Systems
- Intelligent Instruments

### Typical Application

### Pin Descriptions

#### AAT3520, 3522, 3524 (SOT23-3)

Pin #	Symbol	Function
1	GND	Ground connection
2	RESET (AAT3520)	RESET output remains high while $V_{CC}$ is below the reset threshold and remains so for a fixed time period after $V_{CC}$ raises above the reset threshold.
	$\overline{\text{RESET}}$ (AAT3522, AAT3524)	$\overline{\text{RESET}}$ output remains low while $V_{CC}$ is below the reset threshold and remains so for a fixed time period after $V_{CC}$ raises above the reset threshold
3	Vcc	Supply Voltage (+1.2V to +5.5V)

### Part Number Descriptions

SOT23-3 Part Number	Part Description
AAT3520	Reset Output Push Pull Active High with Delay

### Absolute Maximum Ratings ( $T_A=25^\circ\text{C}$ unless otherwise noted)

Symbol	Description	Value	Units
$V_{CC}$	$V_{CC}$ to GND	-0.3 to 5.5	V
$V_{RESET}$	RESET to GND (Push-Pull Output)	-0.3 to $V_{CC}+0.3$	V
	RESET to GND (Open Drain Output)	-0.3 to 5.5	
$I_{MAX}$	Maximum Continuous Input Current	20	mA
$I_{RESET}$	RESET/RESET Current	20	mA
$dV_{CC}/dt$	Rate of rise of $V_{CC}$	100	V/ $\mu\text{s}$
$T_J$	Operating Junction Temperature Range	-40 to 150	$^\circ\text{C}$
$T_{LEAD}$	Maximum Soldering Temperature (at Leads) for 10s	300	$^\circ\text{C}$

Note: Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum rating should be applied at any one time.

### Thermal Information

### Functional Block Diagram

### Functional Description

#### General

During start-up, the reset pin on a microprocessor ensures that it is fully reset and starts up in a known condition. The AAT3520 series of microprocessor reset devices monitor the supply voltage to a microprocessor and assert a reset signal whenever the

$V_{CC}$  voltage falls below a factory programmed threshold. This threshold is accurate within  $\pm 1.5\%$  at  $25^\circ\text{C}$  and within  $\pm 2.5\%$  over the entire operating temperature range. The reset signal remains asserted for a fixed time period ( $t_{RDY}$ ) after  $V_{CC}$  has risen above the threshold as shown in Figure 1. See Ordering Information for available RESET active timeout periods

### Applications Information

#### Reset Output Options

The AAT3524 has an active low open drain output and the AAT3520/2 have a push-pull output. The AAT3524 may be used in multiple voltage systems, with an external pull-up resistor. This allows the AAT3524 to interface to microprocessors with higher supply voltages up to 5.5V (Figure 2). In the event of a power down or brown-out condition the reset signal remains valid until the  $V_{CC}$  drops below 1.2V. To ensure validity down to ground an external 100k $\Omega$  resistor should be connected between the RESET output and GND.

#### Supply Voltage Transient Behavior

In some cases fast negative transients of short duration can appear on the  $V_{CC}$  power supply. The AAT3520 series devices provide some immunity to line transients which can generate invalid reset pulses. Figure 1 shows typical behavior to short duration pulses versus RESET comparator overdrive. As shown in the Maximum Transient Duration vs. Reset Threshold Overdrive graph, when the transient voltage becomes larger, the time allowed before asserting a reset becomes shorter. e.g. typically a transient of 100mV below the reset threshold would have to present for more than 50 $\mu$ s to cause a reset. Immunity can be increased by the addition of a small by-pass capacitor of 0.1 $\mu$ F connected as close to the  $V_{CC}$  pin as possible.
