## Description

The IDT709179 is a high-speed 32K x 9 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT709179 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE_0}$  and  $CE_1$ , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 1.2W of power.

### NOTES:

- "H" =  $V_{IH}$ , "L" =  $V_{IL}$ , "X" = Don't Care.
- $\overline{CE}_0$  and  $\overline{OE}$  =  $V_{IL}$ ;  $CE_1$  and  $R/\overline{W}$  =  $V_{IH}$ .
- Outputs configured in Flow-Through Output mode: if outputs are in Pipelined mode the data out will be delayed by one cycle.
- $\overline{ADS}$  and  $\overline{CNTRST}$  are independent of all other signals including  $\overline{CE}_0$  and  $CE_1$ .
- The address counter advances if  $\overline{CNTEN}$  =  $V_{IL}$  on the rising edge of CLK, regardless of all other signals including  $\overline{CE}_0$  and  $CE_1$ .
- While an external address is being loaded ( $\overline{ADS}$  =  $V_{IL}$ ),  $R/\overline{W}$  =  $V_{IH}$  is recommended to ensure data is not written arbitrarily.

5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle.
7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An +1'. The transition shown indicates the time required for the counter to advance. The 'An +1' Address is written to during this cycle.

## A Functional Description

The IDT709179 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

$\overline{CE}_0 = V_{IH}$  or  $CE_1 = V_{IL}$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT709179's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required with  $\overline{CE}_0 = V_{IL}$  and  $CE_1 = V_{IH}$  to re-activate the outputs.

## Depth and Width Expansion

The IDT709179 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT709179 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 18-bit or wider applications.
