

M5M5V408BFP/TP/RT/KV/KR

4194304-BIT (524288-WORD BY 8-BIT) CMOS STATIC RAM

DESCRIPTION

The M5M5V408B is a family of low voltage 4-Mbit static RAMs organized as 524,288-words by 8-bit, fabricated by Mitsubishi's high-performance 0.25μm CMOS technology.

The M5M5V408B is suitable for memory applications where a simple interfacing, battery operating and battery backup are the important design objectives.

M5M5V408B is packaged in 32-pin plastic SOP, 32-pin plastic TSOP and 32-pin 8mm x 13.4mm STSOP packages. Two types of TSOPs and two types of STSOPs are available, M5M5V408BTP (normal-lead-bend TSOP), M5M5V408BRT (reverse-lead-bend TSOP), M5M5V408BKV (normal-lead-bend STSOP) and M5M5V408BKR (reverse-lead-bend STSOP). These two types TSOPs and two types STSOPs are suitable for a surface mounting on double-sided printed circuit boards.

From the point of operating temperature, the family is divided into three versions; "Standard", "W-version", and "I-version". Those are summarized in the part name table below.

FEATURES

- Single +2.7~+3.6V power supply
- Small stand-by current: 0.3μA(3V,typ.)
- No clocks, No refresh
- Data retention supply voltage=2.0V to 3.6V
- All inputs and outputs are TTL compatible.
- Easy memory expansion by \bar{S}
- Common Data I/O
- Three-state outputs: OR-tie capability
- \bar{OE} prevents data contention in the I/O bus
- Process technology: 0.25μm CMOS
- Package:
 - M5M5V408BFP: 32 pin 525 mil SOP
 - M5M5V408BTP/RT: 32 PIN 400mil TSOP(II)
 - M5M5V408BKV/KR: 32 pin 8mm x13.4mm STSOP

FUNCTION

The M5M5408BFP,TP,RT,KV,KR is organized as 524,288-words by 8-bit. These devices operate on a single +2.7~3.6V power supply, and are directly TTL compatible to both input and output. Its fully static circuit needs no clocks and no refresh, and makes it useful.

A write operation is executed during the \overline{S} low and \overline{W} low overlap time. The address(A0~A18) must be set up before the write cycle

A read operation is executed by setting \overline{W} at a high level and \overline{OE} at a low level while S are in an active state($\overline{S}=L$).

When setting \overline{S} at a high level, the chips are in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips. Setting the \overline{OE} at a high level, the output stage is in a high-impedance state, and the data bus contention problem in the write cycle is eliminated.

The power supply current is reduced as low as 0.3 μ A(25°C, typical), and the memory data can be held at +2V power supply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.

FUNCTION TABLE

\overline{S}	\overline{W}	\overline{OE}	Mode	DQ	I _{cc}
H	X	X	Non selection	High-impedance	Standby
L	L	X	Write	Data input (D)	Active
L	H	L	Read	Data output (Q)	Active
L	H	H	Read	High-impedance	Active

Pin	Function
A0 ~ A18	Address input
DQ1 ~ DQ8	Data input / output
\overline{S}	Chip select input
\overline{W}	Write control input
\overline{OE}	Output inable input
V _{cc}	Power supply
GND	Ground supply

4194304-BIT (524288-WORD BY 8-BIT) CMOS STATIC RAM

Write cycle (\overline{S} control mode)

Note 3: Hatching indicates the state is "don't care".

Note 4: A Write occurs during the overlap of a low \overline{S} and a low \overline{W} .

Note 5: If \overline{W} goes low simultaneously with or prior to \overline{S} , the output remains in the high impedance state.

Note 6: Don't apply inverted phase signal externally when DQ pin is in output mode.
