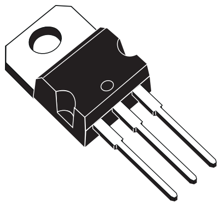
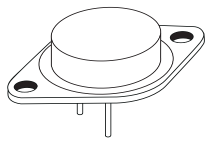
LM137/LM237
LM337

THREE-TERMINAL ADJUSTABLE NEGATIVE VOLTAGE REGULATORS

- OUTPUT VOLTAGE ADJUSTABLE DOWN TO V_{ref}
- 1.5A GUARANTEED OUTPUT CURRENT
- 0.3%/V TYPICAL LOAD REGULATION
- 0.01%/V TYPICAL LINE REGULATION
- CURRENT LIMIT CONSTANT WITH TEMPERATURE
- RIPPLE REJECTION: 77dB
- STANDARD 3-LEAD TRANSISTOR PACKAGES
- EXCELLENT THERMAL REGULATION: 0.002%/V
- 50ppm/°C TEMPERATURE COEFFICIENT



TO-220



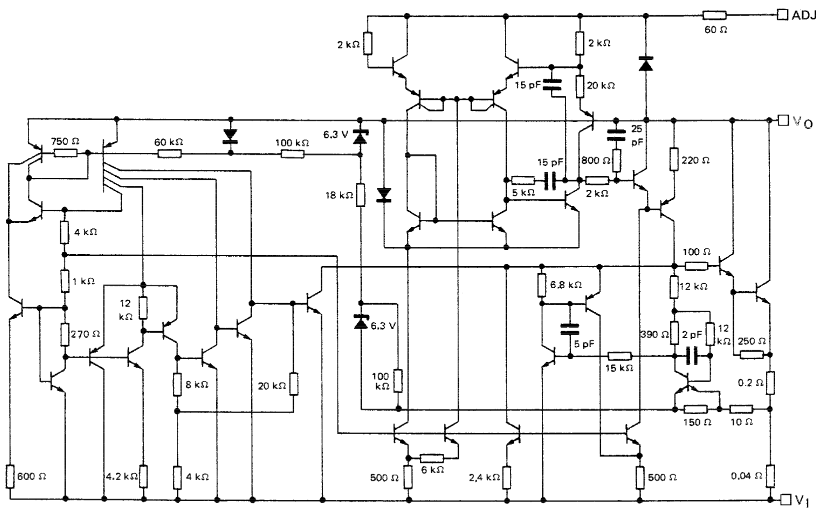
TO-3

DESCRIPTION

The LM137 series are adjustable 3-terminal negative voltage regulators capable of supplying in excess -1.5A over a -1.2 to -37V output voltage range.

They are exceptionally easy to use and require only two external resistors to set the output voltage. Further, both line and load regulation are better than standard fixed regulators. Also, LM137 regulators are supplied in standard transistor packages which are easily mounted and handled. In addition to higher performance than fixed regulators, the LM137 series offer full overload protection available only in integrated circuits. Included on the chip are current limit, thermal overload protection and safe area protection. All overload protection circuitry remains fully functional even if the adjustment terminal is disconnected.

SCHEMATIC DIAGRAM



ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter		Value	Unit
V_I - V_O	Input Output Voltage Differential		40	V
I_O	Output Current		1.5	A
P_{tot}	Power Dissipation		Internally Limited	
T_{stg}	Storage Temperature Range		-65 to 150	°C
T_{oper}	Operating Junction Temperature Range	LM137	-55 to 150	°C
		LM237	-25 to 125	
		LM337	0 to 125	

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.

THERMAL DATA

THERMAL REGULATION

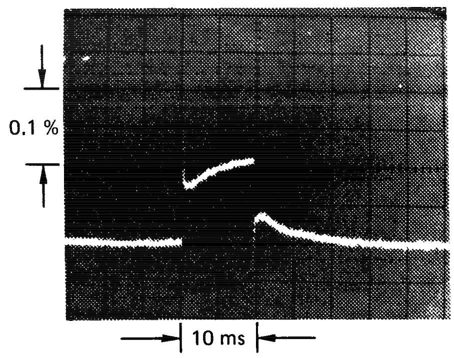
When power is dissipated in an IC, a temperature gradient occurs across the IC chip affecting the individual IC circuit components. With an IC regulator, this gradient can be especially severe since power dissipation is large.

Thermal regulation is the effect of these temperature gradients on output voltage (in percentage output change) per watt of power change in a specified time. Thermal regulation error is independent of electrical regulation or temperature coefficient, and occurs within 5ms to 50ms after a change in power dissipation. Thermal regulation depends on IC layout as well as electrical design. The thermal regulation of a voltage regulator is defined as the percentage change of V_O, per watt, within the first 10ms after a step of power, is applied.

The LM137 specification is 0.02%/W max.In figure 1, a typical LM337's output drifts only 3mV for 0.03% of V_O = – 10V) when a 10W pulse is applied for 10ms. This performance is thus well inside the specification limit of 0.02%/W x 10W = 0.2% max. When the 10W pulse is ended the thermal regulation again shows a 3mV step as the LM137 chip cools off. Note that the load regulation error of about 8mV(0.08%) is additional to the thermal regulation error.

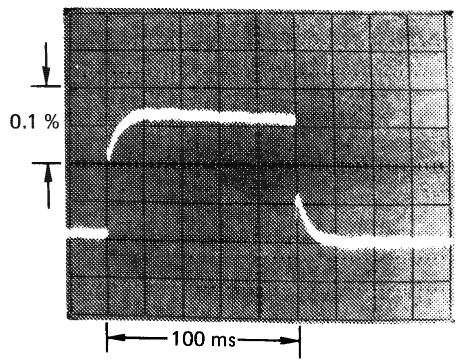
In figure 2, when the 10W pulse is applied for 100ms, the output drifts only slightly beyond the drift in the first 10ms and the thermal error stays well within 0.1% (10mV).

Figure 13 : TYPICAL OUTPUT DRIFT



LM337, VO = -10V, V_I - V_O = - 40V, I_L = 0A → 0.25A → 0A. Vertical sensitivity 5mV/div.

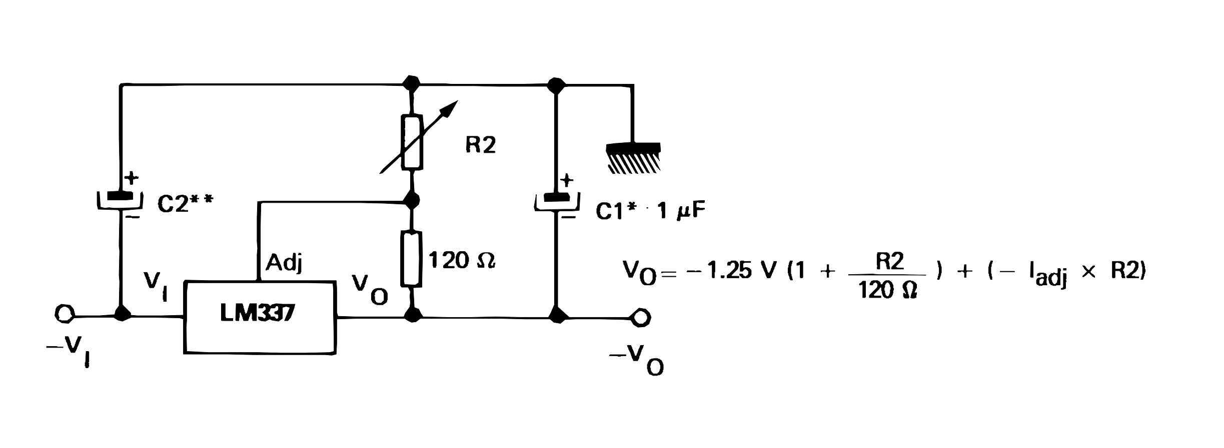
Figure 14 : TYPICAL OUTPUT DRIFT



LM337, VO = -10V, V_I - V_O = - 40V, I_L = 0A → 0.25A → 0A. Horizontal sensitivity 5msN/div.

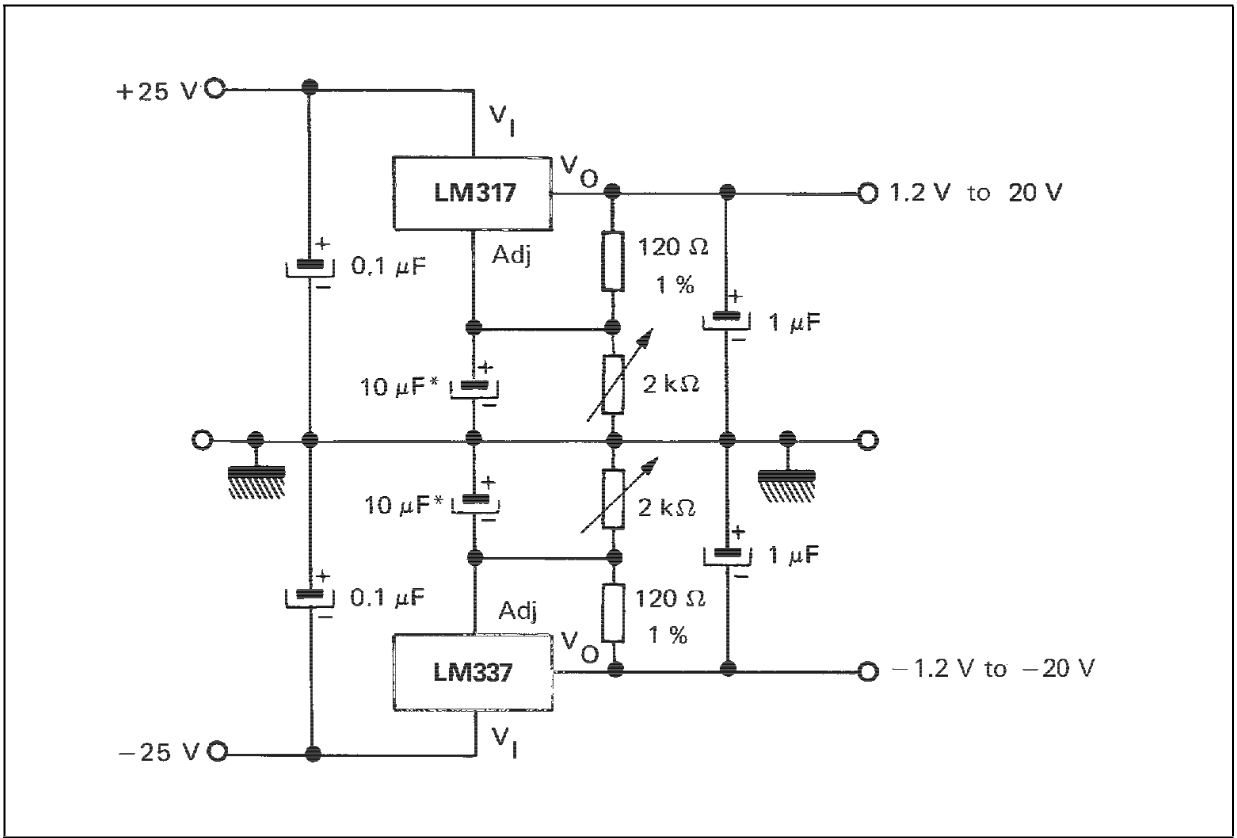
TYPICAL APPLICATIONS

ADJUSTABLE NEGATIVE VOLTAGE REGULATOR



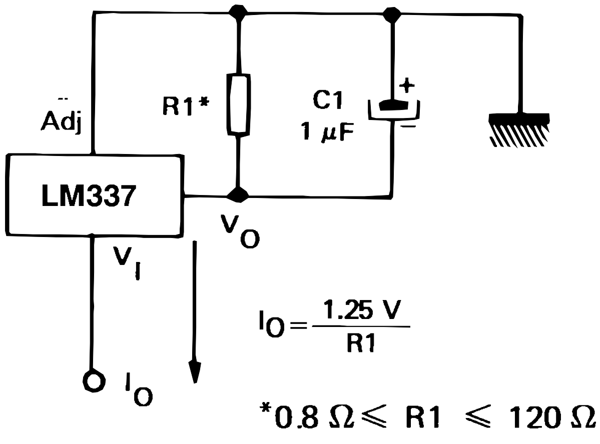
* C1 = 1 µF solid tantalum or 10µF aluminium electrolytic required for stability.
** C2 = 1 µF solid tantalum is required only if regulator is more than 10 cm from power supply filter capacitors

ADJUSTABLE LAB VOLTAGE REGULATOR

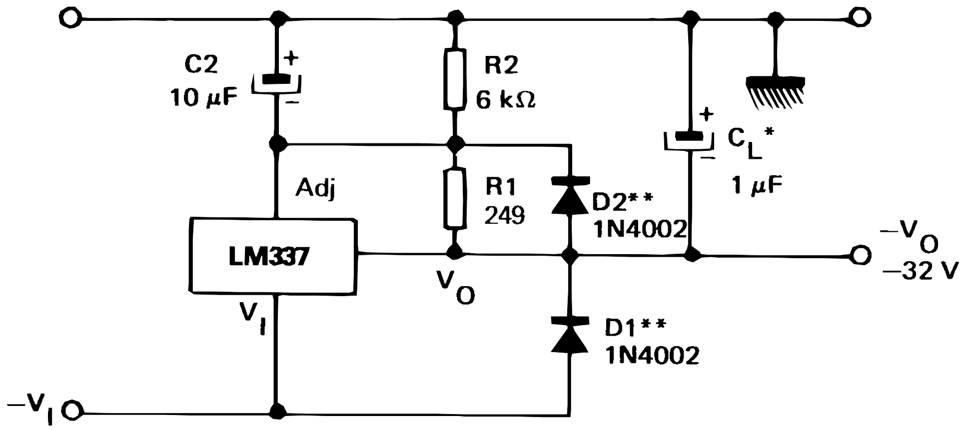


* The 10 µF capacitors are optimal to improve ripple rejection.

CURRENT REGULATOR

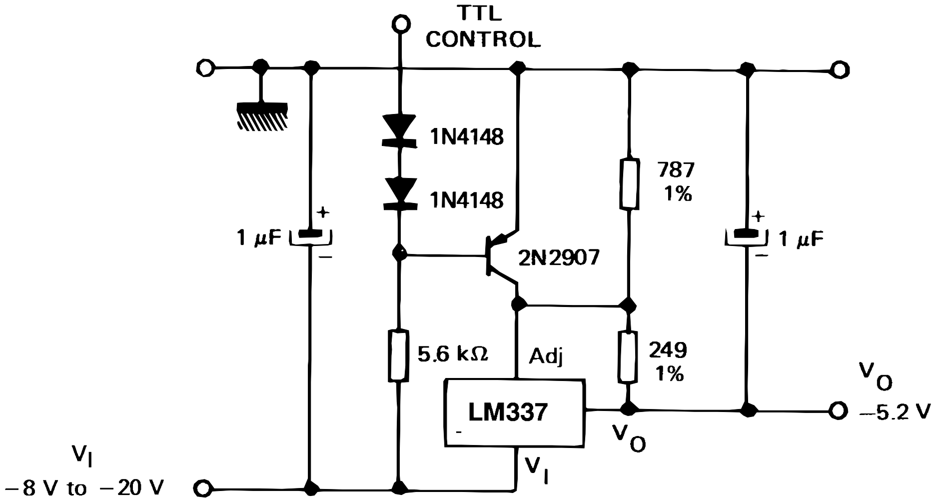


NEGATIVE REGULATOR WITH PROTECTION DIODES



* When CL is larger than 20 µF, D1 protects the LM137 in case the input supply is shorted.
** When C2 is larger than 10µF and VO is larger than -25V, D2 protects the LM137 in case the output is shorted.

*** - 5.2V REGULATOR WITH ELECTRONIC SHUTDOWN**



* Minimum output = - 1.3V when control input is low.
